

Summary

I love using the Instagram Dual camera mode, but it has bugs and there are a few features I would like to add. I would like to build a clone of the Instagram Dual Camera as a standalone camera app and add a few additional features.

Features

- High quality photo and video recording
 - Instagram Dual Camera outputs low resolution videos and photos.
 - Do not record the screen, I want to composite the two videos at full resolution.
- Display both the front and back camera with one in a smaller tile.
 - Smaller tile is a rounded rectangle that matches Instagram.
- Double tap to switch between the front and back cameras.
- Allow pinch to zoom out to 0.5x camera before recording starts.
- Tap the button to take a photo.
- Hold the button to take a video.
 - Drag up to zoom in on the main video
 - Will correctly switch to 1x, 2x, 5x cameras as you zoom in
 - Drag down to zoom out
 - Supports zooming out all the way to 0.5x
- Tile video can be dragged around before and after video is recorded
- Tap tile video to change to circle crop, square crop, rounded rectangle shape.
- Button for setting flash to on, off, or automatic
- Export button to export the combined photo or video
 - Takes into account the position of the tile when the export button is pressed.
- Second export button that can export the two videos separately.
 - Import button that can reimport them to allow me to use the app to composite the two videos into this format.
